

Agile

1-

- As a vanilla git power-user that has never seen GiggleGit before, I want to know what distinguishes GiggleGit from Github, and how to manage GiggleGit and navigate it, so I can be knowledgeable on when to choose GiggleGit.
- As a team lead onboarding an experienced GiggleGit user, I want to provide resources so that it allows them to use GiggleGit more efficiently and to its full potential.

2-

- As a new GiggleGit user, I want a smooth and intuitive onboarding process so that I can quickly start using the platform effectively.
- Task: Develop a comprehensive onboarding tutorial
 - Create a step-by-step tutorial that guides new users through the main features of GiggleGit.
- Ticket: Design the onboarding tutorial
 - Develop a clear tutorial structure that incorporates visual and interactive elements. Consider using memes to align with GiggleGit's branding.

3-

- The statement "As a user I want to be able to authenticate on a new machine" is not a user story because it does not specify who exactly the user is, or give reasoning for why they would want to have that functionality, which is necessary to have a user story. It resembles a non-functional requirement more, as it handles the authentication (the security side) of the software.

Formal Requirements

1. Goal: Get feedback from users on the intuitiveness and user experience of using the SnickerSync tool.
2. Non-goal: User customization is not important at this stage.
3. Non-functional requirement 1: Security
 - a. Functional requirement 1: Receiving user feedback should be encrypted so user data are not susceptible to a data leak
 - b. Functional requirement 2: The interface should not put the users system at risk
4. Non-functional requirement 2: Intuitiveness
 - a. Functional requirement 1: The feedback form should not be too difficult to fill out
 - b. Functional requirement 2: Key features and actions should be easily discoverable.
